

We are working on a new HIV vaccine study that builds on past success and other ongoing studies. This new study is called **HVTN 120**.

---

---

- The Thai Trial has been the only study where the vaccines worked a little. Based on what we learned in that study, we want to improve upon the vaccines being used. We can only do that with more studies.
- Sites in Africa are currently testing some of the same vaccine components in an important efficacy study. This will also help us improve upon what we know.
- HVTN 120 tests the same vaccines as in that study and adds another adjuvant, comparing the two adjuvants head to head. Contact us to learn what all this jargon means!

Research studies are important for moving science forward. Join a paid study to help us find a vaccine that will prevent HIV.

We need people who are HIV negative (do not have HIV), 18-40 years old and in general good health.

Learn more about this cutting-edge research by contacting
